ACTA PALAEONTOLOGICA POLONICA

New palaeoscolecid plates from the Cambrian Stage 3 of northern Mongolia

Acta Palaeontologica Polonica 68 (1) 2023: 117-125 doi:https://doi.org/10.4202/app.01030.2022

New material of disarticulated paleoscolecid remains have been found in “Small Shelly/Skeletal Fossils” assemblages from Cambrian Stage 3 extracted from a section in the Khubsugul Lake region of northern Mongolia. The current material is composed of isolated phosphatic plates, rendering the whole-body reconstruction and comparisons difficult. However, the morphology of the plates is unique enough to warrant description of a new genus and species *Floraconformis egiinensis*. The new taxon is characterised by a stellate depression network spreading from the middle that separates numerous elevations. *Floraconformis egiinensis* gen. et sp. nov. represents one of the oldest records of isolated palaeoscolecid plates.

Key words: Small Shelly Fossils, biomineralization, palaeoscolecid, Cambrian Explosion, Mongolia.
