

## ***Cephalodiscus*-type fibrils in the graptoblast fusellar tissue**

Piotr Mierzejewski

*Acta Palaeontologica Polonica* 29 (3-4), 1984: 157-160

The fusellar tissue of an Ordovician graptoblast has been studied with TEM. It was found that it is solely composed of *Cephalodiscus*-type fibrils, unknown hitherto in graptolites. The fusellar tissue of the studied specimen has more in common with recent pterobranchs than with graptolites.

**Key words:** graptolites, pterobranchs, ultrastructure, Ordovician.
