

Cynodont teeth from the Carnian (Late Triassic) of northern Italy

Silvio Renesto and Spencer G. Lucas

Acta Palaeontologica Polonica 54 (2), 2009: 357-360 doi:<http://dx.doi.org/10.4202/app.2008.0055>

A jaw fragment with three teeth preserved, collected from the Gorno Formation (Carnian, Upper Triassic) of Lombardy (Italy) is described. The teeth are transversely elongated, three-cusped and bear anterior and posterior cingula. Their overall morphology supports their identification as postcanines of a gomphodont cynodont. The unique tooth morphology of the new specimen supports its attribution to a new genus and species, while at the same time precluding positive assignment to already known gomphodont families. There is a fairly small record of gomphodont cynodonts in Europe, so that the described specimen adds to the knowledge of the distribution and diversity of European gomphodonts and it also represents the first ever collected in Italy.
