

## **Colonial volvocales (Chlorophyta) from the Upper Devonian of Poland and their palaeoenvironmental significance**

Józef Kaźmierczak Acta Palaeontologica Polonica 20 (1), 1975: 73-85

First fossil representatives of the modern fresh-water algae from the family Volvocaceae - *Eovolvox* silesiensis gen. et sp. nov. - have been discovered in the Frasnian Amphipora-calcisphaere limestone of Upper Silesia, Poland. The abundant appearance of these algae indicates a very low salinity gradient of the depositional environment, probably close to that of modern eutrophic lacustrine conditions. The algae have been preserved due to rapid carbonate permineralization during preburial and/or early burial stage.
