

Retiolitid graptolite Spinograptus from Poland and its membrane structures

Anna Kozłowska-Dawidziuk Acta Palaeontologica Polonica 42 (3), 1997: 391-412

Spinograptus reticulolawsoni sp. n., *S. latespinosus* sp. n., *S. cf. latespinosus*, and *S. sp.* are described from borecore samples of the late Wenlock (*Colonograptus? praedeubeli* Zone), of the Bartoszyce borehole, NE Poland. They represent an early diversification phase of retiolitids, which followed the *Cyrtograptus lundgreni* Event. Some species display a combination of primitive and advanced characters, implying a mosaic pattern of *Spinograptus* evolution. Most of the material studied contains continuous peridermal membranes, suggesting that they may have been universally present in the retiolitids. Long (2 mm) siculae found in two species of *Spinograptus* contrast with short siculae, known for *Retiolites* and *Paraplectograptus*.

Key words: graptolites, retiolitids, membrane, phylogeny, Silurian, Poland.
