

## A new vent-related foraminifer from the Lower Toarcian black claystone of the Tatra Mountains, Poland

Jarosław Tyszką, Renata Jach, and Miroslav Bubík

*Acta Palaeontologica Polonica* 55 (2), 2010: 333-342 doi: <http://dx.doi.org/10.4202/app.2009.0082>

*Recurvoides infernus* sp. nov., one of the oldest representatives of the superfamily Recurvoidacea (Foraminifera), is described from a thin black claystone overlying the manganese deposits of the Krížna Unit in the Western Tatra Mountains (Poland). These manganese carbonates/silicates were laid down around a shallow–water exhalative submarine hydrothermal vent that was active in the early Toarcian. The microfossils are possibly the first described Jurassic foraminifera associated with hydrothermal vents. The assemblage is characterized by a high abundance and dominance of this new species. The primary lamination of the black claystone, the lack of any macrofauna, and an elevated TOC content point to oxygen–deficient conditions during sedimentation of these deposits. Furthermore, the nearly exclusive occurrence of agglutinated foraminifers suggests a low pH level. It is likely that the foraminifers colonized vent–related bacterial mats which acted as a rich and stable food source. Modern shallow– and deep–water hydrothermal vents may represent similar habitats.

**Key words:** Foraminifera, Ammosphaeroidinidae, agglutinated foraminifera, hydrothermal vent, black claystone, suboxia, the Carpathians, Tethys, Jurassic.
