

First record of the ichnofossil *Atollites* from the Late Cretaceous of the Northern Apennines, Italy

Enrico Serpagli

Acta Palaeontologica Polonica 50 (2), 2005: 403-408

A new radial trace fossil, *Atollites italicum* ichnosp. nov., is reported from Upper Cretaceous sediments of the Northern Apennines (Italy). It is made up of several cylinder-club systems, which are interpreted as radiating in a possible faint spiral pattern from a central shaft. The pre-diagenetic reconstruction of the *Atollites* structure is attempted for the first time. The trace fossil may be attributed to small crustaceans or, less probably, it represents a feeding burrow of other deposit feeders.

Key words: Radial trace fossil, Cretaceous, Apennines, Italy.
